ABSTRACT OF THE DISCLOSURE

5       A device for treatment of mitral annulus dilatation  
comprises an elongate body having two states. IN a first of  
these states the elongate body is insertable into the coronary  
sinus and has a shape adapting to the shape of the coronary  
sinus. When positioned in the coronary sinus, the elongate  
body is transferable to the second state assuming a reduced  
10      radius of curvature, whereby the radius of curvature of the  
coronary sinus and the radius of curvature as well as the  
circumference of the mitral annulus is reduced.
